COURSE PROJECT

Course project

- This is an E-Service product, for example:
  - Webshop;
  - Data management directory, e.g. photo directory with multi-level user administration options, possibility of different photo directories for different users;
  - Survey system;
  - Testing system;
  - Class/team diary;
  - And so on.

If it was an online shop
What should/can be the functionality?

- Front-end
  - Product catalogue*(work with DB, work with arrays).*
  - The products are divided into categories (groups of products) (*work with DB, work with arrays*).
  - Possibility to register a new user (and log in an existing one) (*work with forms (sending using POST method); work with DB (writing to DB); work with COOKIES and SESSION; data validation (can use standard PHP functions)).*
  - Shopping cart (*Work with SESSION (if stored in session); work with DB (if stored in DB); data transfer using GET method (POST is possible)).*
  - Product purchase (delivery address, payment selection (without payment itself) (*work with arrays; work with forms; work with DB (stores the purchase made in DB)).*

If it was an online shop
What should the functionality be?

- **Administrator's environment**
  - Creating/editing categories (*working with forms (POST method); working with DB (storing and updating data); using GET queries (selecting which record to edit)).*
  - Creating a product catalogue (product name, product description, photo, price, etc.); (*working with forms (POST method); working with DB (storing and updating data); using GET queries (selecting which record to edit); "uploading" files to the server (photo)).*
  - Order management (ability to see all orders and their details) (*working with DB (extracting orders); working with arrays (displaying orders); use of GET requests (providing the details of the relevant order)).*

If it was an online shop
What should the functionality be?

- **Design**
  - It can be simple, but the most important thing is that it is easy to shop and manage other information.
  - You can choose from one of the freely available templates;
  - You can create a template using the tools of your choice, e.g. You can use tools like Bootstrap or other frameworks;
  - Adaptive Design (RWD) is not necessary, but its presence is considered an advantage;
  - You can create your own design.

  - **Important: HTML/CSS validity**

If it was an online shop
What additional functionality can be?

- **Client side**
  - Search by name, description, price (*work with forms (GET or POST method); work with DB (database search); work with arrays (displaying results)).*
  - Product filter by category and product attributes (colour, shape, price, size, etc.) (*work with DB (complex SQL query (joining tables) to find data according to the filter)); work with arrays).*

If it was an online shop
What additional functionality can be?

- **Administrator's environment**
  - Creating and assigning attributes to products (*working with DB (creating a more complex structure (about 3 tables with relations)); working with arrays).*
  - Order confirmation/cancellation (*work with GET requests; work with DB (data update)).*

If it was an online shop
What additional functionality can be?

- **Emails**
  - Send an email to a customer when goods are ordered (*PHP mail() function).*
  - Send an email to the customer when the order is confirmed/cancelled.

Questions?

Klausimai?

You can ask them during the consultations :)
